

PRECAST CONCRETE

EFFLUENT PONDS

A new development to a site built concrete effluent tank is our Precast concrete panel tank. Built with modular panels the tank can be 47, 70, 95, 110, 145, 190 and 300 cubic metre sizes. The walls are assembled on site, then the base is poured to complete the tank. With a sloping floor and recess to take the pump these tanks empty completely, thus eliminating the common problem of crusting.

The Precast effluent tank can be built in areas with high water tables and most positions and situations. With the increasing trend towards concrete feed pads the Precast concrete effluent tank is the complete answer to simple and effective dairy shed waste management. The tanks are completed with a safety fence giving peace of mind.

Combined with the Williams pontoon and tank boom the Precast stone trap, and Precast concrete effluent tank offers the complete solution for the larger dairies and environmental requirements.

With the increasing trend towards concrete feed pads the Precast concrete effluent tank is the complete answer to simple and effective dairy shed waste management.
